

# Viscosity AMP

## APEX Management Platform

Viscosity AMP is an integrated platform that manages and monitors your Oracle® APEX applications

# Viscosity AMP

Ensure that your Oracle APEX applications are always managed and monitored with Viscosity AMP

## Overview

If you're running more than a couple of Oracle APEX applications, are you also properly managing and monitoring them? Do you proactively get alerts when errors occur? Can you monitor a specific session and troubleshoot users in realtime? Are your APEX logs preserved indefinitely? Chances are that you've said no to at least some, if not all of those questions. Viscosity AMP - or APEX Management Platform - is a complete suite of tools that provides a centralized and integrated platform that can both manage and monitor any number of APEX applications. Built in APEX itself, Viscosity AMP can seamlessly provide the management and monitoring layer that you need yet have just not found the time to build.

## Management

Viscosity AMP allows help integrate APEX with your identity management solution. If you need two-factor authentication, AMP has you covered there as well. Once the authentication component is established, roles can easily be created and mapped to users. AMP takes just minutes to integrate with your existing applications and does not require any changes to the underlying business rules that you've developed.

AMP also allows you to better manage individual APEX sessions - from viewing session state data, enabling debugging to pausing or even terminating a session, AMP puts you in complete control of your applications - without ever having to login to the actual workspace as a developer.

## Monitoring

AMP provides a large number of reports - page and user activity, errors, logging, authentication attempts - to name a few. These reports can be specific to an application or across all applications. And since AMP is built with APEX, you can customize any of the reports any which way you like.

Want to be the first to know if an error occurs? Or just need a daily summary? AMP's alerting features can provide you with instance updates for a specific error or any error, or alternatively, can just send a summary at the end of the day. In either case, you'll have a clear picture as to where and when errors are occurring in your applications.

## Contact Us

To learn how AMP can help manage and monitor your APEX applications or to arrange a demonstration, please send us a note at [hello@viscosityna.com](mailto:hello@viscosityna.com) or call us on 469-444-1380.
